

# Power Tank Instructions

## Power Shot Upgrade Kit - PTM-1000

Follow this simple guide to upgrade your Power Shot Trigger system with a quick-switch chuck, expanding its versatility and allowing you to change attachments on the fly.

1. Remove the push-on air chuck from the end of your Trigger hose using a 9/16 and a 5/8 wrench

2. Apply teflon tape to the now exposed threads of your Trigger hose (6 layers is recommended). Screw on the Power Flow Female Coupler onto the end of your Trigger hose using a 9/16 and a 3/4 wrench

3. Apply teflon tape to your male plug and screw it into the push-on chuck that you took off your Trigger hose in step 1 using a 9/16 and 5/8 wrench

If you keep your Trigger regulator attached to your Power Shot bottle while it's mounted in its bracket, unclip the air chuck and slide it up through the bottom of the attached loop clamp, then clip it back into the PF Coupler keeping your hose secure and preventing it from bouncing around and damaging your bottle while you're flying through the whoops.
